

# CLINICAL STUDY REPORT: PROTOCOL PH-2024-01

## Study Title: Evaluation of Palbociclib in Advanced Breast Cancer

Inclusion Criteria: Eligible participants were adult female patients aged 18 or older with histologically confirmed estrogen receptor-positive, HER2-negative advanced breast cancer. Patients had not received prior systemic anti-cancer therapy for advanced disease.

## SECTION 4: EFFICACY ENDPOINTS AND CLINICAL OUTCOMES

**The primary endpoint of the study was progression-free survival.**

Progression-free survival was defined as the duration from randomization to objective disease progression assessed by investigator review according to RECIST criteria v1.1, or death from any cause. Secondary endpoints included overall response rate and safety.

Median progression-free survival was 24.8 months in the active treatment group.

## **SECTION 6: SAFETY AND ADVERSE EVENTS**

The most frequently reported adverse events of grade 3 or 4 were neutropenia reported in 66.4% of patients in the treatment cohort, and leukopenia in 24.8%.

Fatigue was noted in 4.2% of patients. Febrile neutropenia occurred in 1.8%.

No treatment-related deaths were documented during the primary evaluation period.
